```
The invention comprises an antibody that specifically binds a regeneration IV (Reg IV) protein. The invention specifically comprises the amino acid and coding sequences of single chain antibody fragments (scr. 8) that bind Reg IV protein. The antibody of the invention is useful for treating, preventing and ameliorating: inflammatory bowel disorders (e.g. ulcerative colitis or Crohn's disease), diabetes (e.g. non-insulin dependent diabetes or insulin dependent diabetes), and cancer of the gastrointestinal tract. The antibody of the invention is also useful for detecting the expression of a Reg IV protein. The present DNA sequence represents a PCR primer that was used to amplify a Reg IV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              testis-specific tubulin tyrosine-ligase-like polypeptide;

This invention relates to a novel testis-specific tubulin tyrosine-ligase
-like polypeptide, designated the BGS-42 polypeptide. The invention may
come useful for the development of compounds with a cytostatic, respiratory
Gen, gastrointestinal-Gen, neuropotective, endocrine-Gen,
antiinflammatory, anabolic, hypertensive, osteopathic, nootropic,
antiinflammatory, anabolic, hypertensive, osteopathic, nootropic,
antiinflammatory antiseborrheic or dermatological activity acting as
tyrosine ligase modulators. In addition, the disclosed sequences may be
compared for diagnosing a pathological condition, or a susceptibility to a
useful for gene therapy. The BGS-42 polypeptide or polymuclectide can be
useful for diagnosing a pathological condition, as a disorder related to aberrant
compared for diagnosing a subject, and for preventing, treating or
ameliorating a medical condition, such as a disorder related to aberrant
compared as activity, aberrant cellular proliferation, reproductive
disorders, testicular disorders, testicular cancer, pulmonary disorders,
carboxypeptidase activity, aberrant cellular proliferation, reproductive
disorders, testicular disorders, testicular cancer, pulmonary disorders,
cubulan lidase activity, aberrant cellular proliferation, reproductive
disorders, brain cancer, liver cancer, proliferative condition
of the testis, lung, small intestine, brain or lymph tissue. The BGS-42
polypeptide can be used as a preventive agent for immunological
disorders including arthritis asthma, AIDS, sepsies, acromegaly, Alchiemer's disease, or Parkinson's disease, or Parkinson's disease or scleroderma. The antibodise may be used to purify, disease or scleroderma. The antibodise may be used to purify, detect and
custor the BGS-42 polypeptides. The present sequence is that of a PCR
custor.

activities: cytostatic, antianaemic, antiarthritic, antiacthmatic, activities: cytostatic, antianaemic, antiarthritic; antiacthmatic, antianaemic, activities: cytostatic, antianaemic, antiarthritic, antiacthmatic, antianaemic, and vulnerary. The albumin fusion protein nucleic acid may be used in gene therapy to treating, preventing or ameliorating diseases or disorders comprising indication: Y. The diseases or disorders include: cancer (e.g. leukaemia, colon, bone, breast, liver or lung cancer), immune or haematopoietic diseases (e.g. anaemia, Hodgkin's disease, acute immune or haematopoietic diseases (e.g. prostatitis, inguinal extra varicoccele, penile carcinoma, ovarian adenocarcinoma or Sertoli-leydig tumours), musculoskeletal disease, gout, muscular dystrophy cardiacaerse, haer valve disease, systemic lupus erythematosus, gout, muscular dystrophy arrhythmia, cardiac arrest, heat valve disease, hypernatraemia or payandrome or Tay Sandrome, Patanaemia), mixed foetal disease (e.g. rhabdomyomas, heart disease, carchexia), cardiac arrest, heat valve disease, hypernatraemia or Tay Sandrome, Patana syndrome, Turnary incontinence, urinary carchial artherism or renal diseases (e.g. urinary incontinence, urinary continents at alterial actions or renal diseases, cerebral meningitis, and action and ac
                                                                                                                                                                                                                                                                                                   The invention relates to a novel albumin fusion protein. The invention further relates to: a composition comprising the albumin fusion protein and a pharmaceutical carrier; a kit comprising the composition of the albumin fusion protein formula; a method of treating a disease or disorder in a patient comprising the step of administering the albumin fusion protein; a method of treating a patient with a disease or disorder that is modulated by Therapeutic protein: X, or its fragment or variant; a method of extending the shelf life of Therapeutic protein: X, or its fragment or variant; a nucleic acid molecule comprising a polynucleotide sequence encoding the albumin fusion protein; a vector comprising the nucleic acid molecule of the albumin fusion protein. The albumin fusion protein and a host cell albumin fusion protein and its compositions have the following
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cereballar ataxia, attention deficit disorder, autism or obsessive compulsive disorder), respiratory disease (e.g. emphysema, lung cancer or occupational lung disease), endocrine diseases (e.g. diabetes, Addison's disease or glomerulonephritis), digestive diseases (e.g. portal hypertension, irritable bowel disease, gastric atrophy or pancreatitis) or connective tissue or epithelial diseases (e.g. crohn's disease, scleroderma, wound healing or epidermolysis bullosa). This polynucleotide sequence represents a primer used in the exemplification of the
                                                                                                  New albumin fusion proteins, useful for diagnosing, treating, preventing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated antibody that specifically binds C3a Receptor, useful for preventing, detecting, diagnosing, treating or ameliorating asthma, allergy, rheumatoid arthritis, systemic lupus erythematosus, arthritis or proliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to an isolated antibody that specifically binds the C3a Receptor, and which is shown in the specification. The antibody is useful for preventing, detecting, diagnosing, treating or ameliorating asthma, allergy, inflammatory or immune disorders. It is also useful for treating, preventing or ameliorating rheumatoid arthritis, systemic lupus erythematosus, arthritis, immunological hypereensitivities, physical trauma, organ transplant rejection, infectious diseases, cardiovascular disorders or proliferative disorders. The present sequence is a PCR primer used to amplify the coding sequence of a VH domain of an antibody directed at the human C3a receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               G-protein coupled receptor; GPCR; BMSOTR; therapy; G-protein coupled signalling; oxytocin-related disorder; eneutological disorder; spinal cord injury; ischaemia; infarction; cardiovascular disorder; acute heart failure; pancreatic cancer; diabetes mellitus; pancreatitis; immune-related disorder; HIV infection; asthma; metabolic disorder; endocrinal disorder; Cushing's syndrome; hyperthyroidism; genetic syndrome; Down's syndrome; Klinefelter's syndrome; Turner's syndrome; human; VH; PCR; primer; ss.

                                                                                                                                                                                                                                                                                                                                     The invention relates to novel methods for producing polypeptide-tagged collections and capture systems containing the tagged polypeptides. The method is useful for evenly distributing tags among members of a starting library. The system, collection, kits and methods are useful in developing pharmaceuticals and diagnostics. The present sequence is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method for the capture and analysis of biological particle using a capture system. The method is useful for
                                                                                                                                                                                              Evenly distributing tags among members of a starting library, useful in developing pharmaceuticals and diagnostics, comprises dividing the starting library into sub libraries and attaching a tag to members of each sub library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Capturing biological particles, by contacting biological particles with capture system comprising addressed loci, addressed collection of polypeptide tagged molecules, capture agents, and polypeptide tag to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to G-protein coupled receptor (GPCR) BMSOTR and its corresponding nucleic acid sequence. GPCR is useful for diagnosing, preventing, treating or ameliorating a medical condition such as disorder related to aberrant G-protein coupled signalling, oxytocin-related disorders, neurological disorders e.g. spinal cord injuries, ischaemia, infarction, etc., disorder related to aberrant cell cycle regulation, cardiovascular disorders such as acute heart failure, disorder of the pancreas e.g. pancreatic cancer, diabetes mellitus, pancreatitis, alcohol asthma, etc., metabolic disorders, endocrinal disorders e.g. Ulvinfections, asthma, etc., metabolic disorders, endocrinal disorders e.g. Cushing's syndrome, hyperthyroidism, etc., mitochondrial DNA aberrations and syndrome, etc. The present sequence is a PCR primer used for amplifying human VH gene. This sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated human G-protein coupled receptor BMSOTR polypeptide and its variant, useful for diagnosing and treating neurological disorders such as spinal cord injuries or ischemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

membranes, viruses, viral capsids, viral particles, bacterial cells, eucharlular compartments, organelles and micelles, prokaryotic cells, eucharlular compartments, organelles and micelles, prokaryotic cells, eucharbotic cells, intracellular particles, nuclei, cell membranes, cell membrane fragments, nuclear membranes fragments, viral capsids with or without packaged nucleic acid, phage, phage vectors or viral capsids with or without encapsulated nucleotide acid, liposomes and other micellar agents. The biological particles are cells, incurons, cancer cells, bacterial cells and infected cells, subcellular compartment, organelles, viral particles or pathogens. The cells neutons, cancer cells, bacterial cells or pathogens. The cells are dendritic cells, T cells, or B cells. The method is also useful for identifying molecules that interact with for identifying a modulator of an interaction among proteins in the trafficking, activity or functional or structural property in the biological particle, for identifying molecules that modulates the biological particle, and for mapping epitopes of molecules displayed on the surface of a biological particles, for identifying a receptor on the surface of a biological particle that transduces a signal from a polypeptide, and continue molecule that interacts with an apically continued molecule that interacts with an apically continued molecule molecule molecule and interacts with an apically continued molecule molecule that interacts with an apically continued molecule molecule molecule molecules displaced molecules and continued molecules and interacts with an apically continued molecule molecule molecule molecules and molecules and continued molecules and interacts with an apically continued molecule molecule molecule molecules and molecules
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

nucleoside subunits joined by intersubunit linkages, where at least 3 contiguous subunits are joined by phosphoramidate intersubunits. The contiguous subunits are joined by phosphoramidate intersubunits. The contiguous subunits are joined by phosphoramidate intersubunits. The coligodeoxyribonucleotides has a sequence of nucleoside subunits effective to form a duplex with a target nucleic acid molecule. The coligodeoxyribonucleotides are more resistant to nuclease digestion and have improved RNA and dsDNA hybridisation characteristics, relative to oligonucleotides not containing N3·P5' phosphoramidate linkages. They also have excellent antisense activity against complementary mRNA targets in in-vitro cell growth inhibition assays. They also exhibit low cytcoxicity. They may be used in diagnostic and therapeutic applications, e.g., in combatting infections agents such as bacteria, viruses, ect. or in treatment of smooth muscle cell proliferation disorders, inflammatory processes, certain genetic disorders, cancers, etc. . The present sequence represents an oligonucleotide of the invention Oligo:nucleotide N3'-P5' phosphoramidate(s) - have improved resistance toward phosphodiesterase digestion, and form stable duplexes with DNA and /*tag= a /note= "each base is linked by N3'-P5' phosphoramidate linkages" 1. .10

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The primers and probes AAQ97705-8 were used to study the expression of the rat melanocortin receptor gene in rat brains. Primers AAQ97705-6 were used to PCR amplify a 225 bp fragment of the rat melanocortin receptor MC-5 coding sequence (AAQ97701). Detection of this fragment was carried out using the probes AAQ97701-8. Probes designed on the sequences of the rat or human (AAQ97702) receptor genes can be used in diagnosis of cardiovascular, renal, neurological, psychiatric, gastro-intestinal or neuro-endocrinal diseases (e.g. arterial hypertension, disturbed intestinal function, motor and secretory disorders, dysfunction of the adrenal gland, etc.) associated with qualitative or quantitative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Rat; melanocortin receptor; probe; dopamine; striatum; human; primer; PCR; amplification; expression vector; cardiovascular; renal; motor; neurological; psychiatric; gastro-intestinal; neuro-endocrinal; arterial hypertension; disturbed intestinal function; secretory disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New rat and human melanocortin receptor MC-5 - and related nucleic acid, transformed cells etc. useful for screening cpds. and for diagnosis and treatment of e.g. cardiovascular disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention concerns an anti-Tie (Tyrosine kinase-Immunoglobulin like domain-EGF (epidermal growth factor) homology domain) monoclonal antibody (MAD) which specifically recognises the Tie extracellular domain, and a hybridoma producing it. The MAD can be used in the diagnosis of leukaemia and also in separation and concentration of haematopoietic stem cells. The MAD can also be used to detect and determine levels of (soluble) Tie. AAT33121-22 are primers used to amplify a 160 bp probe based on a tyrosine kinase domain, to detect the human Tie gene from a UT-7 cDNA library. A 3933 bp cDNA clone, ptk-1, was identified, encoding a 1138 amino acid residue protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Genomic DNA analysis; 5' variation generator; 3' fragment generator; endangered animal identification; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Anti-Tie monoclonal antibody and hybridoma producing it - useful in diagnosis of leukaemia and detection of haematopoietic stem cells.

The patent discloses a method and associated kit for analysing genomic DNA in a sample. The method comprises conducting a nucleic acid semplification on the genomic DNA in the sample using both first and second oligonuclectide primer to produce DNA fragments based on repeat sequences on at least one end of the genomic DNA. The first primer is a formation generator including a repeat sequence and at least one non-repeat nucleotide. The second oligonucleotide primer is a 3 fragment generator starting within such a genetic distance that amplification of the genomic DNA can be performed and preferably includes inosine. The method is useful for the genetic analysis of an individual organism, particularly of a species or individual. It is also useful for the rapid and straight forward identification of endangered animals or plants. The
                                                                                                                                                                                  Analyzing genomic DNA in a sample, useful for analyzing genes of organisms (e.g. a species or individual) or identifying endangered animals or plants, by using oligonucleotide primers comprising universal variable fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             professional forward identification of endangered animals or plants. present DNA sequence is a 5' variation generator oligonucleotide PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Genomic DNA analysis; 5' variation generator; 3' fragment generator; endangered animal identification; PCR primer; 88.

The patent discloses a method and associated kit for analysing genomic DNA in a sample. The method comprises conducting a nucleic acid amplification on the genomic DNA in the sample using both first and second oligonuclectide primer to produce DNA fragments based on repeat sequences on at least one end of the genomic DNA. The first primer is a 5' variation generator including a repeat sequence and at least one norrepeat nucleotide. The second oligonucleotide primer is a 3' fragment generator starting within such a genetic distance that amplification of the genomic DNA can be performed and preferably includes inosine. The method is useful for the genetic analysis of an individual organism, particularly of a species or individual. It is also useful for the rapid and straight forward identification of endangered animals or plants. The
                                                                  Analyzing genomic DNA in a sample, useful for analyzing genes of organisms (e.g. a species or individual) or identifying endangered animals or plants, by using oligonuclectide primers comprising universal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               present DNA sequence is a 5' variation generator oligonucleotide PCR

New transgenic mice having a genetically modified fibroblast growth factor receptor gene, useful as a model for human chondrodysplasia, e.g. achondroplasia characterized by shortening of the limbs, midface hypoplasia or large skull.

```
The invention relates to an animal model for chondrodysplasia, more transgenic mouse model for achondroplasia. This transgenic mouse contains a fibroblast growth factor receptor 3 (FGFR3) gene including a G to A point mutation changing Gly to Arg in codon 380 in its genome. The transgenic mouse is useful as a model for FGFR-ssociated chondrodysplasia, particularly FGFR3 achondroplasia, e.g. shortening of the limbs, midface hypoplasia and large skull. This model may be exploited to gain better understanding of the disease and as an experimental model with which experimental therapy to chondrodysplasias can be exercised. The transgenic mouse is particularly useful as a tool for screening, developing and evaluating drugs with a potential of relieving or abolishing chondrodysplasia syndromes and/or symptoms. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          present sequence is a PCR primer used to detect human FGFR3 allele
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 17 BP; 3 A; 5 C; 6 G; 3 T; 0 U; 0 Other;

Novel compound targeted to a nucleic acid molecule encoding fibroblast growth factor receptor 3, useful for inhibiting the expression of the receptor and for treating an animal having cancer or developmental

Example 13; Page 76; 120pp; English.

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3) ACH, TYK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophlylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 by with an (AGL)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information in the bovine phovine microsatellite sis summarised in the sequence information specification and indexed herein (see below). The sequence information consistence of the microsatellite sequence were used to generate the microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                            ö
patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is human FGFR-3 DNA specific PCR primer. This primer is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polymorphic bovine DNA markers - used in genetic identification, gene

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

microsatellite (using the program OPTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             economically important traits esp. in cattle, to allow selective breeding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine Mbol DNA fragments of between 250 and 500
by with an (AC)15 and a (TC)15 oligonuclectide probe. One out of 50
clones cross-hybridised. Assuming independent distribution of
microsatellites and Mbol sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
comnstream of the microsatellite sequence waset to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTIPRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
connectally important traits esp. in cattle, to allow selective
breding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

creening a library of bovine Miol DNA fragments of between 250 and 500 by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequence information for ca. 230 such bovine microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp.

To sed to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economic ally important traits esp. in cattle, to allow selective

This (CA)9 simple sequence repeat is used to illustrate the novel method for detecting SSR polymorphisms without the need for direct sequencing or gel electrophoresis. The length of a particular repeat region (i.e. number of repeats) can be highly polymorphic; the sequences flanking repeat region, however, are conserved. Detection of a SSR of a specific length is achieved by successful ligation of two oligonucleorides, one being exactly complementary to the repeat region and one of its conserved flanking sequences and the other being complementary to the other conserved flanking sequence. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating bacterial infections in humans or animals with oligo:nucleotide(s) - resistant to nuclease and targetted to bacterial nucleic acid or proteins, also conjugates of these oligo:nucleotide(s) with antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nuclease resistant antisense oligo NBT 141 targeted against (AC)9.
                                                                                                                               Detecting genetic variation between organisms - by detecting polymorphisms in simple sequence repeats in DNA of organisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nuclease resistant; bacterial infection; antibiotic; target; veterinary medicine; treatment; human; industrial process; bacterial control; ss.

                                                                                                                                                                                                                                                                                           A (CA)9 simple sequence repeat is used to illustrate the novel method for detecting SSR polymorphisms without the need for direct sequencing or gel electrophoresis. The length of a particular repeat region (i.e. number of repeats) can be highly polymorphic; the sequences flanking the repeat region, however, are conserved. Detection of a SSR of a specific length is achieved by successful ligation of two oligonucleotides, one being exactly complementary to the repeat region and one of its conserved flanking sequences (i.e. comprising the sequence (GT)9) and the other being complementary to the other conserved flanking sequence. ઠે 염 The treatment of animals, including humans, having a bacterial infection. The treatment of animals, including humans, having a bacterial infection. The treatment comprises administration of such nuclease resistant coligonucleotides, trageted to a nucleic acid or protein of the bacterium, and formulated with a carrier. A compound comprising this nuclease resistant oligonucleotide can be covalently linked to an antibiotic. The method is used to treat infections by a wide variety of Gram-positive and Gram-negative, or acid-fast, bacteria, in human and veterinary medicine. The methods are particularly used in immuno-compromised individuals (e.g. patients with acquired immunodeficiency syndrome or those receiving chemotherapy or radiation therapy), optionally in combination with, or tused to, antiviral or other antimicrobial oligonucleotides. Apart from therapout use, the oligonucleotides can be used to control bacteria in laboratory cultures, foods, beverages and industrial processes. The oligonucleotides are specific for bacteria, without affecting metabolism in mammalian cells. They may also activate RNase H and have a general, on mammalian cells. They may also activate RNase H and have a general, on mammalian calls, intranasally, rectally, topically or by injection, optionally coupled to an agent (e.g. carbohydrate or polyamine) that ö Gaps ö Score 17; DB 1; Length 18; Pred. Quantitating genetic instability.

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from tumour cells and genomic DNA from normal cells. The method involves the cells from the same individual crom normal cells. The method involves the cells from the same individual with oligonucleotide primers selected from adenine and quantine and x = 3-7 (ii) a nucleotide sequence (CG)xRK, where R is as in (i) and Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iii) anucleotide sequence (CG)xRK, where R is as in (i) and x = 3-7, (iii) anucleotide sequence (CG)xRK, where X is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CG)xRK, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CA)xRK, where R is a purine and guanine and X = 6-16, (vii) a nucleotide sequence (CA)xRK, there R is a purine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRR,

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from tumour cells and genomic DNA from normal cells. The method involves the cells from the same individual cromparison pair comprising genomic DNA from tumour cells and genomic DNA from normal cells. The method involves the cells from the same individual with oligonucleotide primers selected from define and quanine and x = 3-7 (d); a nucleotide sequence (CG)xRY, where R is as in (i) and X is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iv) a nucleotide sequence (CG)xRY, where R is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CA)xRY, where R is a purine selected from dennine and ynanine and x = 6-16, (vi) a nucleotide sequence (CA)xRY, where R is a purine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where R is a purine selected from adenine and guanine and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where R is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where X is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination of the primers. The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating comparison genomic DNA from tumour cells and genomic DNA from tumour cells and genomic DNA from tumour cells and genomic DNA from tumour cells. The method involves the cells from the same individual with oligonucleotide primers selected from adenine and quantine and x = 3-7 (ii) a nucleotide sequence (CG)xRV, where R is as in (i) and Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (iii) a nucleotide sequence (CG)xRY, where R is as in (i) and x = 3-7, (iv) a nucleotide sequence (CG)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CG)xRY, where R is a purine selected from adenine and guantine and x = 6-16, (vi) a nucleotide sequence (CA)xRY, where R is a purine selected from adenine and guantine and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, and (ix) a combination of the primers. The method is useful for detecting genomic instability which are commonly associated with the various stages of neophastic transformation and carcinogenesis. The method is rapid and simple

```

Sequencing reagent array; primer; capture moiety; hybridisation; detection; mutation; diagnosis; infectious disease; ss.

Sequencing reagent array oligonucleotide primer #28.

used to detect

Reagent for nucleic acid sequencing by primer extension, mutations and to diagnose infectious or genetic diseases

Example 7; Page 27; 47pp; English.

This invention describes a novel method for quantitating genetic instability independent of microsatellite alterations by treating a comparison pair comprising genomic DNA from tumour cells and genomic DNA from tumour cells and genomic DNA from normal cells. The method involves the cells from the same individual cfrom normal cells. The method involves the cells from the same individual with oligonucleotide primers selected from adenine and guanine and x = 3- (G)xRG, where R is as in (i) and Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 3-7, (ii) a nucleotide sequence (CG)xRY, where R is as in (i) and X = 3-7, (iii) and cytosine, thymine, and uracil and x = 3-7, (v) a nucleotide sequence (CG)xRY, where R is a purine selected from adenine and guanine and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where R is a purine selected from adenine and guanine and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where R is a pyrimidine selected from adenine and guanine selected from cytosine, thymine, and uracil, and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where Y is a pyrimidine selected from cytosine, thymine, and uracil and x = 6-16, (vii) a nucleotide sequence (CA)xRY, where X is a pyrimidine selected from cytosine, thymine, and uracil and uracil and x = 6-16, and the primers. The method is useful for detecting genomic instability which are commonly associated with the various stages of neoplastic transformation and carcinogenesis. The method is rapid and simple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention describes a sequencing reagent (I) comprising: (a) a capture group (GG) that can form a stable complex with a region of a template nucleic acid (II); (b) spacer region (SR); and (c) sequence complex nucleic acid (II). (b) spacer region (SR); and (c) sequence complementary sequence on (II). Also described are: (l) array comprising complementary sequence on (II). Also described are: (l) array comprising (C) method of sequencing (II) using a combinatorial array of (I). Arrays of (I) are used for sequencing nucleic acids by a primer extension complexed. (a) method, e.g. to scan for mutations (particularly single-nucleotide collymorphisms) and for diagnosis of infectious and genetic diseases. Arrays of (I) allow sequencing of templates without any prior knowledge of the wild-type or expected sequence. By separating the capture and specific hybridisation functions, it becomes possible to use smaller primers, simplifying array analysis, reducing costs and allowing cost simplifying array analysis, reducing costs and allowing methods i.e. since primers are required, compared with standard methods i.e. since primer array of n-mers will be as effective as an array of methods i.e. since primers will be as effective length of the primer by 1 base, an array of n-mers will be as effective as an array of n-mers in usual methods. The method may be applied to single or double-stranded by A. Aryofful represent sequencing reagent contains the contains and array of method may be applied to single or double-stranded by A. Aryofful represent sequencing reagent contains and array of method may be applied to single-or double-stranded by A. Aryofful represents sequencing reagent array and allowing array and allowing array and allowing array and allowing array are are described by a pagent array and array of method may be applied to single-or double-stranded by Aryofful represents sequencing reagent array are array are array array are array are array array are array are array array are array array array array array 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Simple sequence repeat; plant; ds; SSR; ryegrass; fescue; tandem repeat; cereal profiling; grass profiling; seed batch purity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence crepeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer 2-6 nucleotides in length. Also included are a nucleic acid primer controlled for amplifying an SSR, identifying (M1) an SSR by preparing a clibrary of ryegrass or fescue genomic DNA enriched for SSRs and cidentifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely casociated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a cereal for DNA porfiling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal ceed batches by assessing variation within seed batch of an SSR. The SSRs con profiling grass or cereal species varieties, for testing the purity of grass or cereal section of genes in grass or cereal breeding, for profiling grass or cereal species varieties, for testing the purity of grass or cereal seed batches, and for DNA profiling to establish the contained the contained of the present cereal section of genes or cereal preceding, for distinct identity, uniformity and/or stability of a cultivar. The present
  The invention relates to a substantially purified or isolated nucleic acid (1) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2.6 nucleotides in length. Also included are a nucleic acid primer 2.6 nucleotides in length. Also included are a nucleic acid primer continued for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or feecue genomic DNA enriched for SSRs and cidentifying clones in the library containing SSRs, a library of ryegrass or feecue genomic DNA enriched for SSRs and the W1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal seed batches by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal seed batches, and for DNA profiling to establish the closely distinct identity, uniformity and/or stability of a cultivar. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.4%; Score 17; DB 1; Length 18; 00.0%; Pred. ```
The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence crepeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer 2-6 nucleotides or fescue genomic DNA enriched for SSRs and core in the library of ryegrass or fescue genomic DNA enriched for SSRs and included are a nucleic as and core in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the MI, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal seed batches by assessing variation within seed batch of an SSR. The SSRs may be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal species varieties for testing the purity of grass or cereal seed batches, and for DNA profiling to establish the content of distinct identity, uniformity and/or stability of a cultivar. The present
                                                                                                                                                                                                                                                                                                                                                                                        New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Simple sequence repeat; plant; ds; SSR; ryegrass; fescue; tandem repeat; cereal profiling; grass profiling; seed batch purity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0.4%; Score 17; DB 1; Length 18;

The invention relates to a substantially purified or isolated nucleic acid (1) from ryegrass or fescue species including a simple sequence repeat (SSR), having 2 or more tandemly repeated nucleotide core elements 2-6 nucleotides in length. Also included are a nucleic acid primer cautable for amplifying an SSR, identifying (M1) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and cannow in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing variation between SSR varieties and testing the purity of grass or cereal species varieties, for profiling grass or cereal species varieties, for profiling grass or cereal species varieties, for testing the purity of grass or cereal species varieties, and for DNA profiling to establish the clisting tidentity, uniformity and/or stability of a cultivar. The present sequence is a ryegrass or fescue SSR
                                                                                                                                                                                                                                                                                                                                                               New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Synthetic oligomucleotide; dinucleotide repeat; cytostatic; apoptosis; cell cycle arrest; cell proliferation; caspase; cytokine; interleukin; tumour necrosis factor; TNF; cancer; carcinoma; sarcoma; leukemia;

```
The present sequence is that of a synthetic oligonucleotide useful to the invention. The invention relates to a composition, comprising a 2 to 20 base 3'-OH, 5'-OH synthetic oligonucleotide which comprises multiple repeats of dinucleotides such as GT, TG, etc., according to specific formula and having cytostatic activity. The oligonucleotide compositions are useful for inducing cell cycle arrest, inhibition of proliferation, activation of caspases and induction of apoptosis or production of cytokines such as interleukin (IL)-1-beta, IL-6, IL-10, IL-12 and tumour necrosis factor (TNP)-alpha by immune system cells, in an animal having cancer such as primary carcinoma, secondary carcinoma, primary sarcoma and secondary sarcoma such as, leukemia, lymphoma, breast, prostate, colorectal, ovarian or bone cancer. The compositions independent of Fas, p53/p21, p21/waf-1/CIP, p15/ink4B), p16(ink4), drug resistance, caspase 3, transforming growth factor (TGF)-beta 1 receptor
                                                                                                                                                                                                                                                                            Composition comprising synthetic oligonucleotides which comprise multiple repeats of dinucleotides such as GT, TG useful for treating cancer by inducing cell cycle arrest, inhibiting proliferation, activating

The present sequence is that of a synthetic oligonucleotide useful to the invention. The invention relates to a composition, comprising a 2 to 20 abses 3.-04, 5.-04 synthetic oligonucleotide which comprises multiple repeats of dinucleotides such as GT. TG, etc., according to specific formula and having cytostatic activity. The oligonucleotide compositions are useful for inducing cell cycle arrest, inhibition of proliferation, activation of caspases and induction of apoptosis or production of cytokines such as interleukin (IL)-1. beta, IL-6, IL-10, IL-12 and tumour necrosis factor (INF)-alpha by immune system cells, in an animal having

The present invention relates to Simple Sequence Repeats (SSRs) from clover species. SSRs, also called microsatellites, are based on a 1-7 mucleotide core element which is trandemly repeated. The SSR array is embedded in complex flanking DNA. SSRs are ideal markers for genome mapping, trait mapping and marker-assisted selection. The SSRs may be used in methods for selecting genes in clover/ legume breeding. The SSRs are also useful for DNA profiling of clover varieties and for testing the purity of legume seed batches. The present sequence is a SSR motif, which was used in the present invention
                                                        Novel simple sequence repeats in clover species useful for selection of genes in legume breeding, for profiling legume species varieties and for testing the purity of legume seed batches.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sheep prion protein microsatellite locus primer #67.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                  suppression (SPRE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kies for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a coligonucleotides are useful for genotyping a nucleic acid sample by serious as single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence or oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, besch-nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial diseases of which a component is or may be genetic such as autoimmune diseases including, rheumatoid arthritis, multiple sclerosis, microorganism. The method is also useful in forensic investigations and microorganism. The present sequence represents a PCR primer specific paternity analysis. The present

The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and determining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.
                                                                                                     gene typing; polymorphic microsatellite loci; PML; disease; disease predisposition; microsatellite marker; prion disease; cystic fibrosis; malignant hyperthermia syndrome; metabolic disease; milk protein; hormone; transcription factor; pT7-blue-vector; sheep;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 3; Page 30; 64pp; German.

more PML; and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a disease-related gene, that are associated with a predisposition to diseases and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, hormones or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the sheep prion protein (PrP) comprising a polymorphic microsatellite locus. predisposition to a disease, associated with a gene that includes one or 8866666666666688888

New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding TGF-beta 2, useful for treating cancer, a neurodegenerative disorder, or a disease involving hyperactivation of immune response

Example 16; SEQ ID NO 141; 135pp; English.

The invention relates to a novel antisense compound of 8-80 nucleobases in length targeted to, and which specifically hybridizes with, a nucleic acid molecule encoding transforming growth factor (TGF) beta 2, and inhibits the expression of TGF-beta 2. The invention further relates to a compound 8-80 nucleobase in length that specifically hybridizes with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding TGF-beta 2, a composition comprising the compound and carrier or diluent, inhibiting the expression of TGF-beta 2 in cells or tissues by contacting the cells or tissues with the compound so that expression of TGF-beta 2 is inhibited; treating an animal having a disease or condition associated with TGF-beta 2 by administering to the animal a therapeutic or prophylactic amount of the compound so that

expression of TGF-beta 2 is inhibited, and screening an antisense compound. The antisense compound has cytostatic, nootropic, neuroprotective, and immunosuppressive activities. The compound composition and methods are useful for treating a disease or condition associated with TGF-beta 2, such as a hyperproliferative disorder e.g. cancer, a neurodegenerative disorder, or a disease or condition involving hyperactivation of an immune response. This polynucleotide sequence hyperactivation of an immune response. This polynucleotide sequence represents an antisense oligonucleotide of the invention. 8\$666666688888

New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding TGF-beta 2, useful for treating cancer, a neurodegenerative disorder, or a disease involving hyperactivation of immune response.

Example 16; SEQ ID NO 262; 135pp; English.

The invention relates to a novel antisense compound of 8-80 nucleobases in length targeted to, and which specifically hybridizes with, a nucleic acid molecule encoding transforming growth factor (TGF)-beta 2, and inhibits the expression of TGF-beta 2. The invention further relates to:

a compound 8-80 nucleobase prior of an active site on a nucleic acid at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding TGF-beta 2; a composition comprising the compound and a carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or tissues by contacting the cells or tissues with the compound so that expression of TGF-beta 2 is inhibited; treating an animal having a disease or condition associated with TGF-beta 2 by administering to the animal a therapeutic or prophylactic amount of the compound so that animal a therapeutic or prophylactic amount of the compound so that compound. The antisense compound has cytostatic, nootropic, neuroprotective, and immunosuppressive activities. The compound,

thuman mPGES-1 gene is located on chromosome 9, more specifically to gad 4.3. The present invention also describes: (1) antisense compounds, baving a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal condition associated with mPGES-1. MPGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiamatory, neuroprotective, nootropic, antistnession; (2) antihibitors and an gardiant, neuroprotective, associated, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound condition associated with mPGES-1, infimmation, Alzheimer's dispase, arthibite dishers and in gene therapy. The antisense compound condition associated with mPGES-1 e. infimmation, Alzheimer's

counteract hypertension in the course of glucocorticoid administration to a patient, diagnosing a lesion as a tumour reducing the hypertensive of aide effect of a glucocorticoid administration regime in a patient, or for tumour therapy. The agents, e.g. adrenomedullin, CGRP or functional analogues of the peptides are useful in manufacture of a preparation for reducing the hypertensive side effect of a glucocorticoid administration regime. The compound that up-regulates CRLM gene expression or the up-regulator of CRLM gene promoter activity is also useful in the up-regulator of a preparation for reducing the hypertensive side-effect of a glucocorticoid administration regime or for treating a condition where it is desired to promote vasodilation and/or angiogenesis. The compound that up-regulates CRLM expression in microvascular endothelial cells under hypoxic conditions is useful in the manufacture of a medicament for use in tumour therapy, e.g. a patient identified as having a tumour constitute of a combined preparation for simultaneous, sequential or combined administration of the compound with an analogue is useful in the manufacture of a preparation for up-regulating the CRLM or elevated Corresponding mMNA. It is a also care an analogue is useful in the manufacture of a preparation for up-regulating the CRLM gene promoter in micro vascular endothelial cells or cragulating the CRLM gene promoter in micro vascular endothelial cells or corresponding mNA in the manufacture of a preparation for up-capulating a glucocorticoid responsive promoter derived from a cRLM gene in a vector administered for gene therapy. The compound capulating a glucocorticoid responsive promoter derived from a crientified as an up-regulator of CRLM gene in up-regulating responsive promoter derived from a crientified as an up-regulator of CRLM gene in up-regulating responsive promoter derived from a crientified as an up-regulation of the compound and a vector administered for gene therapy. The compounce in a vector administered for gene p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      flanking region PCR primer.

ö The invention relates to a novel method for identifying a subject at risk of breast cancer comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a subject at risk of breast cancer, for early diagnosis, prevention and treatment of breast cancer, possibly via gene therapy, as well as to analyse and predict a response to a breast cancer treatment and in clinical drug trials. The current sequence is that of an Extend primer (also described as probe) of the invention which was used to genotype human intercellular adhesion molecule ICAM-1/ICAM-4/ICAM-5 gDNA. ICAM-1 (human rhinovirus receptor; BB2 postition 19p13.2-p13.2, ICAM-4 (Landsteiner-Wiener blood group; LW) has been mapped to chromosomal position 19p13.2-cen and ICAM-5 Identifying a subject at risk of breast cancer by detecting the presence of polymorphic variations in the ICAM, MAPKIO, KIAA0861, NUMA1 or GALE regions which are associated with breast cancer in a nucleic acid sample Gaps telencephalin) has been mapped to chromosomal position 19p13.2. ; 0 Score 17; DB 1; Length 20; Pred. Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding.

Table 7; Page 389; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of

Suitable primers are given in AAQ7472-500. Amplified sequences are hybridized to capture probes (AAQ75501-05), and hybridization is detected using detection probes (AAQ75506-09, AAQ86975). Expression of E6/E7 is diagnostic for cervical cancer or pre-malignancy states. (Updated on 25-MAR-2003 to
                   in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the seperation and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program OPTIRRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait loci, or genes involved the determinism of economically important traits esp. in cattle, to allow selective breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

(The PUR protein was originally identified as a 27AD HeLa cell nuclear factor that bound in a sequence-specific manner to single-stranded PUR elements). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cloning and expression of PUR protein, involved in regulation of DNA replication - also oligo:nucleotide(s) and antibodies for use in the treatment of proliferative diseases, e.g. cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 oligodeoxyribonuclectides are more resistant to nuclease digestion and have improved RNA and dsDNA hybridisation characteristics, relative to oligonucleotides not containing N3'-P5' phosphoramidate linkages. They also have excellent antisense activity against complementary mRNA targets in in-vitro cell growth inhibition assays. They also exhibit low cytotoxicity. They may be used in diagnostic and therapeutic applications, e.g., in combatting infections agents such as bacteria, viruses, etc. or in treatment of smooth muscle cell proliferation disorders, inflammatory processes, certain genetic disorders, cancers, etc. . The present sequence represents an oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The specification describes oligodeoxyribonucleotides having contiguous nucleoside subunits joined by intersubunit linkages, where at least 3 contiguous subunits are joined by phosphoramidate intersubunits. The oligodeoxyribonucleotides has a sequence of nucleoside subunits effective to form a duplex with a target nucleic acid molecule. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligo:nucleotide N3'-P5' phosphoramidate(s) - have improved resistance toward phosphodiesterase digestion, and form stable duplexes with DNA and

disorders, inflammatory processes, certain genetic disorders, cancers, etc. . The present sequence represents an oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          nuclegate subunits joined by intersubunit linkages, where at least 3 contiguous subunits are joined by phosphoramidate intersubunits. The oligodeoxyribonucleotides has a sequence of nucleoside subunits effective to form a duplex with a target nucleic acid molecule. The oligodeoxyribonucleotides are more resistant to nuclease digestion and have improved RNA and dsDNA hybridisation characteristics, relative to oligonucleotides not containing N3-195, phosphoramidate linkages they also have excellent antisense activity against complementary mRNA targets in in-vitro cell growth inhibition assays. They also exhibit low cytotoxicity. They may be used in diagnostic and therapeutic applications, e.g., in combatting infections agents such as bacteria, viruses, etc. or in treatment of smooth muscle cell proliferation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligo:nucleotide N3'-P5' phosphoramidate(s) - have improved resistance toward phosphodiesterase digestion, and form stable duplexes with DNA and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The specification describes oligodeoxyribonucleotides having contiguous

The primers AAT99265-T99269 were used to PCR amplify and isolate the complete sequence of the human PUR-alpha gene (AAT99264). This primer corresponds to nucleotides 990-1009 of the PUR sequence. The PUR sequence can be used to identify chemical or biological compounds that bind to PUR or binding fragments of PUR. Inhibitors of PUR activity may be used to
                                                      PUR protein ligands or modulators - using immobilised PUR fragments, to treat hyper-proliferative diseases, e.g. cancer.
                                                                                                                                                                                                       Sequence 20 BP; 9 A; 8 C; 1 G; 2 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                   The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequence-tagged site (UM-STS) primers. The primers are used to develop genomic maps, to isolate clones from libraries, to make cross-species comparisons and to develop additional genetic markers. UM-STS allow genomic comparisons to be made between more species
                                                                                                                                                                                                                                New oligonucleotide primers amplifying gene regions conserved among mammals - useful for developing genomic maps, isolating clones and making cross-species comparisons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 human; c-myc; inhibitor; hyperproliferative disease; ss; primer; amplification.

```
This is the nucleotide sequence of the PUR psecific PCR primer used for amplification in the method of the invention, involving the use of the PUR protein and its fragments, which inhibit PUR protein binding to PUR element or other proteins. Inhibitors of PUR activity may be useful for treating viral infections and hyperproliferative diseases such as cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PUR protein and its fragments - that inhibit PUR protein binding to PUR

The invention provides a novel method for isolation of satellite sequences from genomic DNA that comprises fragmentation of the DNA by a method which is not dependent on base sequences, then selection of the satellite sequences from the obtained genomic library of high homogeneity. The method is useful for the isolation of microsatellite DNA sequences which can be used as DNA markers. The new method markedly improves the efficiency of isolation of satellite sequences in comparison to prior art methods which are reliant on base sequences. Sequences AAZ98483-514 represent sequences from Haliotis discus, used in the method
                                                                                                                                                                                                                                                                                                                                                         Isolation of satellite sequences from genomic DNA for use as DNA markers comprises isolating a library with high homogeneity by DNA fragmentation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a monoclonal antibody that specifically binds to an epitope of the PUR protein. Antibodies that bind to the PUR protein and neutralise PUR activity may be used to treat hyperproliferative diseases such as cancer. PUR antibodies may be used diagnostically to detect aberrant expression of the PUR protein and/or mutations in the PUR gene. The present sequence represents a PUR-lipha RACE primer which is used in an example from the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to antisense compounds up to 30 nucleobases in length targeted to a E2F transcription factor 1 The invention is useful for inhibiting the expression of E3F transcription factor 1 in cells or tissues. The antisense oligonacleotides may also be used as a research agent and to prevent infection, inflammation or tumours
                                                                                                                                                                The present invention describes the rat Nurrl coding and protein sequences. The Nurrl protein is involved in the induction of tyrosine hydroxylase expression in adult rat-derived hippocampal progenitor cells. The Nurrl gene and protein can be used in the treatment of catecholaminerelated diseases such as Parkinson's disease, manic depression and schizophrenia. They can also be used to induce tyrosine hydroxylase expression and identify tyrosine hydroxylase related deficiencies, which are linked to the same diseases. The present sequence is a PCR primer used in a method to differentiate adult neural progenitor cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense; E2F transcription factor 1; human; infection; inflammation;
                                                       Cell comprising exogenous nucleic acid inducing tyrosine hydroxylase expression useful for treating catecholamine-related diseases such as Parkinson's disease, manic depression and schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense compound capable of inhibiting the expression of E2F transcription factor 1, useful for preventing or delaying infection,
                                                                                                                                                                                                                                                                                                                                                                                                                              ;

polypeptide comprising a monomer polypeptide with a molecular weight of 30 kDa. p30 is also called LiGHT because this is homologues to cytokine. p30 is also called LiGHT because this is homologues to Lymphotoxine, exhibite Inducible expression, and competes with HSV clycoprotein D for HVEM, a receptor expressed T lymphocytes.p30 binds to lymphotoxin beta receptor expressed T lymphocytes.p30 binds to lymphotoxin beta receptor (LIV SR)-mediated polypeptide (HVEM). p30 is useful for inhibiting virus production in cells and for modulating a lymphotoxin beta receptor (LIV SR)-mediated cellular response. p30 is useful for treating inflammatory disorders, tumours, for blocking the entry of herpes virus info cells, and to treat or prevent chrose virus infections such as beta herpes virus and cytomegalovirus. p30 is also useful for inhibiting p30-mediated cellular response e.g., inhibition of a lymphocyte (a pathogenic effector cell) cellular response cuch as lymphocyte proliferation. The inhibited lymphocyte response modulates a T or B lymphoma or an autoimmune disease such as rheumatoid arthritis, insulin dependent diabetes mellitus, multiple sclerosis,
                   diseases associated with hibeta4BP expression, particularly conditions involving aberrant or deregulated cell proliferation (e.g. cancer). The hibeta4BP polynucleotide is used in gene therapy. The present sequence is an antisense oligonucleotide targetted to hibeta4BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; herpes virus entry-mediated; HVEM; p30; immunosuppressive; tumour; Hufflammatory disorder; herpes virus infection; lymphocyte proliferation; neuroprotective; dermatological; virucide; gene 'therapy; PCR primer; SLE; systemic lupus erythematosus; autoimmune disease; diabetes mellitus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polypeptide useful for inhibiting herpes virus production in cells, comprises isolated or recombinant homotrimeric p30 polypeptides which bind to lymphotoxin receptor and to herpes virus entry-mediated

The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying a candidate polymorphic repeat within a coding sequence, for

Optionally some nucleotides with 2'-methoxyethyl (2'-MOE wings) modification"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to novel antisense oligomucleotides (ABZ81522-ABZ81593) which are targeted to human protein kinase A (PKA) regulatory subunit RII beta mucleotide sequence (ABZ81513), and which specifically hybridise with and inhibit the expression of the PKA regulatory subunit RII beta (PKA is also known as cAMP-dependent protein kinase). The antisense oligomucleotides are useful for modulating the kinase). The antisense oligomucleotides are useful for modulating the conditions associated with aberrant expression of PKA regulatory subunit RII beta, e.g. diabetes or cancer. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of various members of a biological pathway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antieense oligonucleotides targeted to nucleic acid encoding protein
kinase A regulatory subunit RII beta, useful in treating diseases e.g.
cancer associated with the aberrant expression of the protein kinase.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entitlanmatory steroid and ubiquinone. A composition of the invention has antiinflammatory antiallergic, antiasthmatic, hypotensive, commonsuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or correction a respiratory lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiallammatory steroid in a subject, for reducing levels of adenosine or receptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition. Once: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at the control of the control

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Claim 15; SEQ ID NO 126; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of, or reducing sensitivity to adenosine, reducing levels of useful or receptor, producing bronchodilation, increasing levels of usigninone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Disclosure; SEQ ID NO 3318; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation coodon, coning region, 5 or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine of receptor, producing bronchodilation, increasing levels of adenosine or receptor, producing bronchodilation, increasing levels of defence of the receptor. lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO ftp.wipo.int/pub/published_pct_sequences

A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, antisense; lung dysfunction; nasal airway dysfunction; antinflammatory steroid; ubiquinone; antinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to genes encoding key enzymes in the biosynthesis of alpha-methylene-gamma-butyrolactone (tulipalin A). Key enzymes include glutamate decarboxylase, gamma-aminobutyrate aminoburgate aminoransferase. The including bytoxybutyrate dehydrogenase and UDP-glucosyltransferase. The invention is useful for producing tulipalin A or tuliposide A or its pathmay intermediates such as alpha-methylenesuccinate semialdehyde, alphamethylene-gamma-aminobutyrate or alpha-methylene-gamma-hydroxybutyrate. Tulipalin A sequences are used to immunise animals to produce polyclonal or monoclonal antibodies with specificity for them or as targets to facilitate design and/or identification of inhibitors of those enzymes that may be useful as herbicides. The present sequence is a primer used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated nucleic acid fragment encoding a tuliposide A synthesizing protein, useful for creating recombinant organisms that have the ability to synthesize tulipalin A, tuliposide A or tuliposide A pathway intermediates.
                                                                                                                                                                                                                                                                                                                    Alpha-methylene-gamma-butyrolactone; glutamate decarboxylase; herbicide; enzyme; gamma-aminobutyrate aminotransferase; UDP-glucosyltransferase; gamma-hydroxybutyrate dehydrogenase; tulipalin A; plant; primer; PCR; ss.

WPI; 2003-093058/08.

to Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted tnucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 3318; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstruction, respiratory tract inflammation, allergies and bronchoconstruction, respiratory tract inflammation, allergies and condition depolation or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-drenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, prevent any unwanted effects due to it

Sequence 20 BP; 6 A; 5 C; 6 G; 3 T; 0 U; 0 Other;

ô comprising oligonucleotides, effective for alleviating bronchocometriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depoletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mkNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, beta addrensive, immunosuppressive and cytostatic activity, is a beta-addrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; antiandsessive; cytostatic; cyetic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory disease; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer. composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, This invention describes a novel composition (a) a first active agent Gaps S antisense, bronchoconstriction, allergy, hyposecretion, pain, Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and Katz E, Pabalan J, Aguilar D; ö Length 20; Indels Score 16.8; DB 1; Pred. instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchocomstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distructs pain, cystic fibrosis, allergic rhintis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the pulmonary intention rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the pulmonary intention speam into products that free adenosine into the system of the vilgonucleotides into products that free adenosine into the system of prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenargic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis;

including autoimmune diseases, degenerative nervous system diseases, cardiversus host diseases, hypersensitivity diseases, infectious diseases, and neeplastic diseases. Autoimmune diseases, infectious diseases and neeplastic diseases. Autoimmune diseases, include Addison's diseases, arrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type is hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those caused by viruses such as Hypersensitivities such as those caused by viruses such as Hose caused by viruses such as Hose caused by viruses such as those caused by viruses such as those caused by the yeast genus Candida, parasitic infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Kit for diagnozing and treating T-cell associated diseases e.g.

                                                                                                                              This invention describes a novel composition, alleriating active agent, comprising oligonuclectides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and concedence sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction accorder and can be anti-sense to the corresponding mRNA.

The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antiinflammacory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung corresponding to inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, confined and submanation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system correction and unique to it the oligonucleotides into products that free adenosine into the system correct of the oligonucleotides into product expect to it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                             This invention describes a novel composition (a) a first active agent,

This invention describes novel oligonuclectides derived from microsatellite markers and used for the amplification of the rose genome. The invention also describes a test kit for genetic analysis of cultured cor wild forms of the genus Rosa sp. that contains at least one of the new coligonuclectide primers and preparing microsatellite markers of Rosa sp. by PCR amplification of hypervariable genomic regions, using at least one primer pair, to produce polymorphic fragments which are separated and detected. The primer pairs flank the microsatellite locus being amplified. The amplified markers are separated by electrophoresis, cespecially on high-resolution agarose or native or denatured polyacrylamide gels, or by mass spectrometry. After separation, the amplicons are detected by staining (ethidium bromide or silver), radioactive labelling and autoradiography, automated sequencing using primers labelled with dyes or fluorophores or by mass spectrometry. A cadioactive labelling and autoradiography, automated sequencing using primers labelled with dyes or fluorophores or by mass spectrometry. A cadioactive detected by staining (ethidium bromide or silver), coli and the cells tested against a high-density array of synthetic microsatellites. Inserts in plasmids that hybridised were sequenced and microsatellites. Inserts in plasmids that hybridised were sequenced and the introvated and wild types of roses, particularly for genetic mapping and labelling of mono- or poly-genic traits, selection, analysis of cultivated and wild types of roses, particularly for genetic or radioactive detection methods and can differentiate between a compined or methods and can differentiate between almost all commercial rose varieties. ADH68375 ADH68474 represent the PCR primers commercial rose varieties. ADH68474 represent the PCR primers contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                    New oligonucleotides from rose microsatellite markers, useful for genomic analysis, including identification of varieties and hybrids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 20 BP; 7 A; 9 C; 2 G; 2 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of mucleic acid primers specifically priming and allowing amplification of each Wbeta gene, whetars. The kit is useful for diagnosing organ transplant crejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, cor graft versus host disease, Autoimmune diseases include Addison's diseases. Cor artophic gastritis. Degenerative nervous system diseases include multiple artophic gastritis. Degenerative nervous system diseases include multiple cor sclerosis and Alzhehmer's disease. Hypersensitivity diseases include multiple is sclerosis and Alzhehmer's disease. Hypersensitivities such as those conformed in leprosy. Infections such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those caused by the yeast genus Candida, parasitic infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by Mycobacterium. Neoplastic diseases include viral infections such as those caused by Mycobacterium. Neoplastic diseases include a such as those caused by whochacterium. Neoplastic diseases include lymphoproliferative diseases couch as leukaemias, lymphomas and cancers such as cancer of the brain, becaut. The present sequence represents a Vbeta gene repeat sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a Vbeta gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhintis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the

The present sequence represents a chimeric antisense oligonucleotide targeted to human microscomal prostaglandin E2 synthase (mEGES-1). The human megES-1 gene is located on chromosome 9, more specifically to ogg4.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding meGES-1, which specifically pybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal white a disease or condition associated with mPGES-1. MPGES-1 chimeric antidabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, immunomodulator, cardiant, neuroprotective, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound con the used as mPGES-1 inhibitors and in gene therapy. The antisense compound con the used as mPGES-1 inhibitors and in gene therapy. The antisense compound condition associated with mPGES-1 e.g., inflammation, Alzheimer's diabetes, cancer, isochaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (medES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of having a disease or condition associated with mpGES-1. MpGES-1 and having a disease or condition associated with mpGES-1. MpGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic immunomodulatory and cardiovascular activities, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound

                        The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to ogd4.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 0.30 by targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding continuis its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal continuis a disease or condition associated with MPGES-1. MPGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiabetic, usacotropic, antidiabetic, immunomodulator, and antidiabetic, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound to ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound con the used as mPGES-1 inhibitors and in gene therapy. The antisense compound cor an be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                            ô

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to operate invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antisidabetic, immunomodulator, cardiant, neuroprotective, antiinflammatory, neuroprotective, nootropic, antianthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Altheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

The invention relates to a compound targeted to a nucleic acid molecule encoding the human ABCCS polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibite expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human ABCCS polypeptide and in preparation of a composition for trreating hyperproliferative disorders, e.g. cancer. This sequence repersents an antisense oligonucleotide targeted to DNA encoding the human ABCCS polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, ABCC5; ss; antisense oligonucleotide; phosphorothioate linkage;
2'-0-methoxyethyl sugar moiety; 5-methylcytosine;
hyperproliferative disorder; cancer; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            New oligonucleotide compound that inhibits expression of ABCC5, useful for preparing a composition for treating hyperproliferative disorder,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL) -4 receptor, interleukin (IL) -5 receptor, CCR1, CCR3, Ectanial, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDB4 A, PDB4 B, PDB4 C or PDB4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The coligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin -4 receptor, interleukin-5 receptor, CCR1, CCR3, Botaxin-1, RANTES, MCP4, CD23, ICAM, tryptase a, tryptase b, PDB4 B, PDB4 C, or PDB4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of adenosine A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          receptor(ë), and/or asthma and/or lung allergies associated with inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (FF), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or

                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a compound targeted to a nucleic acid molecule encoding the human ABCCS polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibite expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylyrosine. The antisense compounds are useful for modulating the expression of the human ABCCS polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence reperseants a human ABCCS DNA antisense oligonucleotide target region of the invention.
                                                                                                                                                                                                          New oligonucleotide compound that inhibits expression of ABCC5, usefu
for preparing a composition for treating hyperproliferative disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human acetyl choline muscarinic receptor 3 polymorphic sequence #9.

This invention relates to the sequence of an isolated nucleic acid
molecule comprising at least one base variation from that of a known
human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2),
cytochrome P450 O2E1 (CYP45002E1), adrenergic receptor beta1 (ADBR1),
contain (ARBP), cathapsin S (CTSS), cytochromes 2 (COX2), diazapam binding
cytochrome P450 O2E1 (CYP45002E1), adrenergic receptor (BRIZ), bistamine-N-methyl
cransferase (HNMT), NADBH quinone-S-transferase 12 (GYT12), histamine-N-methyl
cransferase (HNMT), NADBH quinone-S-transferase 2 (EMC2),
culfoctansferase (HNMT), NADBH quinone-S-transferase 2 (EMC2),
culfortansferase 2 (EMC2), NADBH quinone-S-transferase 2 (EMC2
                                                                                                                                                                 Isolated nucleic acid molecules having polymorphisms in known human genes eg. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polymorphic DNA sequence of the invention

                                                                                                                                                                                                                                                                                                   The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human tumour necrosis factor beginning at nucleotide 1137 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therappy of diseases characterised by specific DNA duplex targets, e.g. HPV, HBR; HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. See also AAQ25452-25501 and AAQ30226-448s. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tumour necrosis factor; herpes simplex; AIDS; modified; HIV; RSV; HPV; malignancy; hepatitis; inflammation; 88.

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human tumour necrosis factor beginning at nucleotide 1137 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others

                         regions of the merlin gene. NF2 is a neurofibromatosis which is characterised by bi-lateral schwannomas. The NF2 "gene" has been shown by linkage studies to be assigned to chromosome 22. The missing or mutated
The sequences given in AAQ71073-76 are primers which were used to amplify
                                                                                                             denotes a protein, merlin (moesin-erzin-radixin-like protein), which encodes a protein, merlin (moesin-erzin-radixin-like protein), which possesses tumour suppressor activity, and whose tumour suppressor activity, and whose tumour suppressor possesses tumour suppressor. The merlin gene is found on chromosome 22 between the known markers D2281 and D22828. The merlin gene may be used in gene therapy for the treatment of a merlin-associated tumour or NF2, or for prevention of schwannoma, meningioma, posterior capsular lens opacities, deafness or hearing loss, balance disorders or paralysis.                                                                                                                                                                                                                                                                                                                                                                                                        The sequences given in AAQ61825-50 and AAQ61886-906 are oligonucleotides which contain a q4 or two q3 stretches and which may be used for inhibiting replication of herpes simplex virus (HSV). Oligonucleotides such as these may also be used for inhibiting activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase AZ activity in cases of hyperproliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                          New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length

of naturally occurring nucleobases covalently bound to a polyamide backbone and (b) hybridise to the translation initiation AUG region, 5' untranslated region (3' UTR), splice untranslated region (3' UTR), splice junctions or coding sequence of a human immunodeficiency virus gene chosen from env, gag, pol, rev and tat. The PNAs can be used to trarget RNA and single stranded DNA (8sDNA) to produce antisense type gene regulation moieties. They have utility as gene-targetted drugs for modulating HIV processes. Hence they can be used to treat AIDS and other viral infections. They are also useful in diagnostic applications and as created bulk. They are also useful in diagnostic applications and as stranded DNA. They are also useful in diagnostic applications and as treanded DNA. They are also able to form triple helices in which a first PNA strand binds with RNA or ssDNA and a second PNA strand binds with the first PNA strand binds with the first PNA strand binds with the first C resulting double helix or with the first PNA strand binds with a second significant charge and are water soluble, which facilitates cellular uptake. Further, since they contain amides of non-biological amino acids, they are abjoated and resistant to enzymatic degradation by proteases.
                                                                                           /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z28825 represent human polymorphic sites described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Genetic proximity, gene expression, cell characterisation, homeobox gene; genetic defect, reverse transcriptase polymerase chain reaction; RT-PCR;
